ASSIGNMENT 3 - HTTP + CRUD
Praktikum Web IF-O

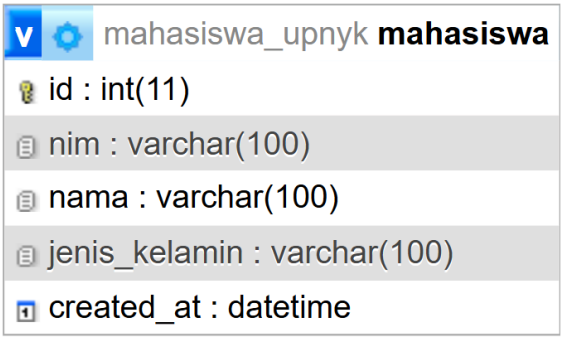

➢ Assignment Overview

In this assignment, you are required to build a web application interface and connect it with a MySQL database to implement full CRUD functionality (Create, Read, Update, Delete). You will create the user interface pages from scratch specifically for this assignment.

Your main task is to build the front-end layout using .php files, set up database connectivity, and ensure all dynamic features function correctly. Make sure to configure form inputs and HTTP Methods (GET/POST) properly to enable seamless data transmission between client and server.

➢ Database Specification

1. Set up a new database with the following requirements and table schema:
   a) **Database Name:** Flexible / Custom (you may choose your own database name).
   b) **Table Name**: mahasiswa
2. Table Schema: mahasiswa

➢ Required Features & Specification

1) Main Dashboard (index.php)

- Display all records from the **mahasiswa** database table in a structured table format.
- If **no data exists in the database**, display an empty state message such as “Tidak ada data!” (No data available).

- Provide an **Add Data** (Tambah Data) button on the dashboard header, as well as **Update** and **Delete** action buttons within each table row.

2) Add Data Page (tambah.php)

- Build a form to insert new student records into the **mahasiswa table**.
- Upon successful submission, automatically redirect to the main dashboard and display the newly added record.

3) Update Data Page (update.php)

- Render a form pre-populated with existing record data corresponding to the selected record ID.
- Change the primary submit button text to **"Update".**
- Upon saving changes, redirect back to the dashboard showing the updated information.

4) Delete Data Feature

- Clicking the **"Delete"** button triggers a pop-up confirmation modal displaying the specific student's name to be removed.
- Confirming the deletion removes the record permanently from the database.
- The deleted record must no longer appear in the dashboard view.

5) Search Data Feature

- Include a functional search bar on the main dashboard.
- Entering a student name and clicking the "**Cari**" (Search) button must filter and update the dashboard table view according to the search query.
- **Hint :**

```php
if(isset($_GET['cari']))
{
    $cari_nama = $_GET['cari'];$sql = "SELECT * FROM mahasiswa WHERE nama LIKE '%$cari_nama%'";
}
$result = mysqli_query($koneksi,$sql);
```

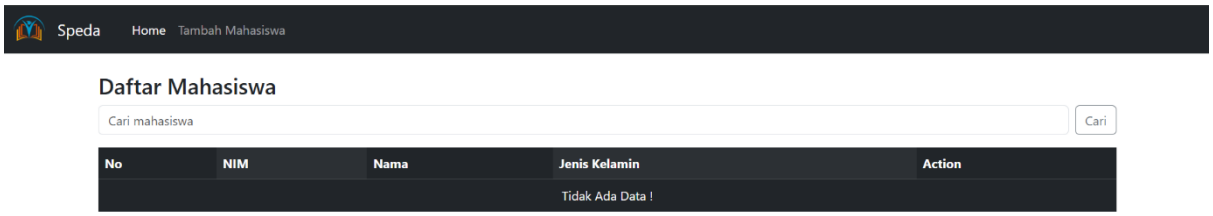

➢ Images:

For the image requirements in this assignment, you can download them at the following link:
https://drive.google.com/file/d/1SSkbXk0EUtTsveHr4IYtHvetfKWpb00b/view?usp=sharing

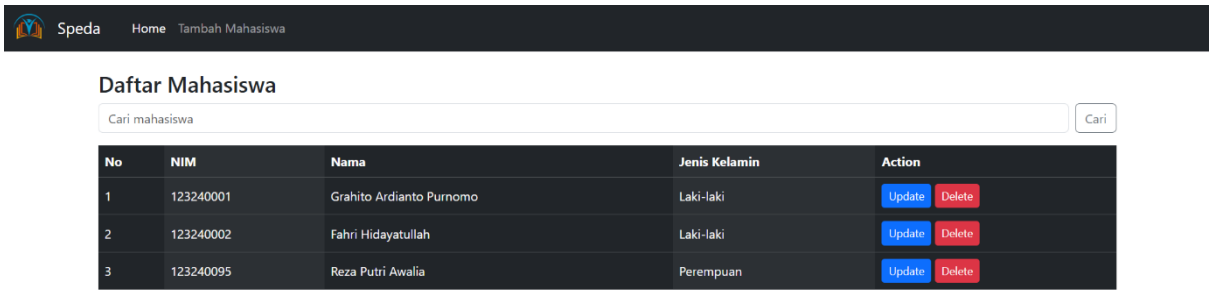

➢ Website Screenshots & Descriptions

Hint : Navbar, Modal, Button, Table, Form → bootstrap

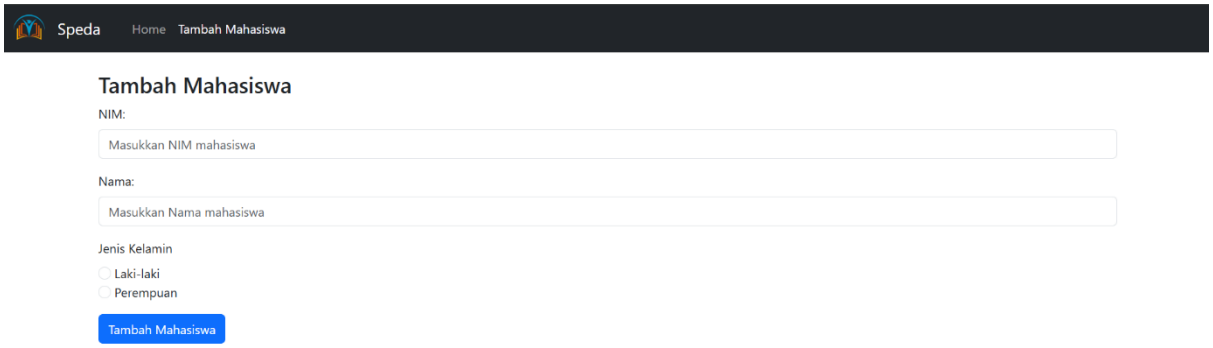

Hint : The search form can be taken from a Bootstrap navbar 1, then moved outside of the navbar and placed into its own **div**.

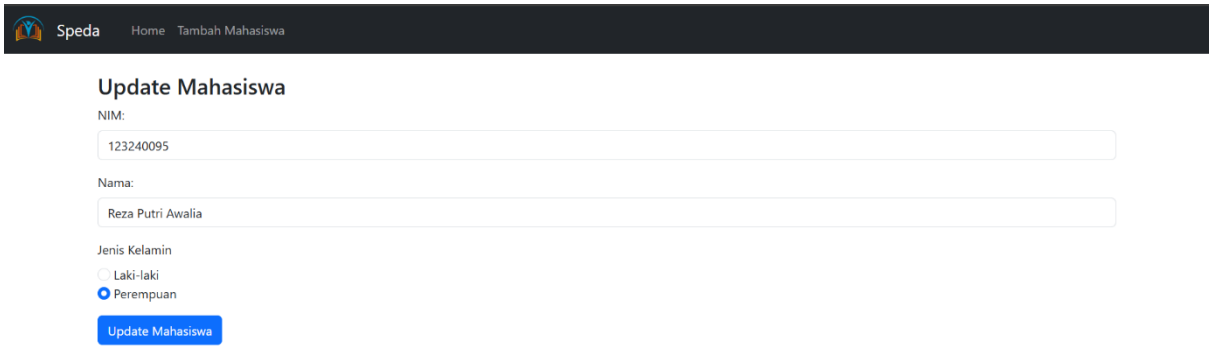

Main Dashboard page when there is no data

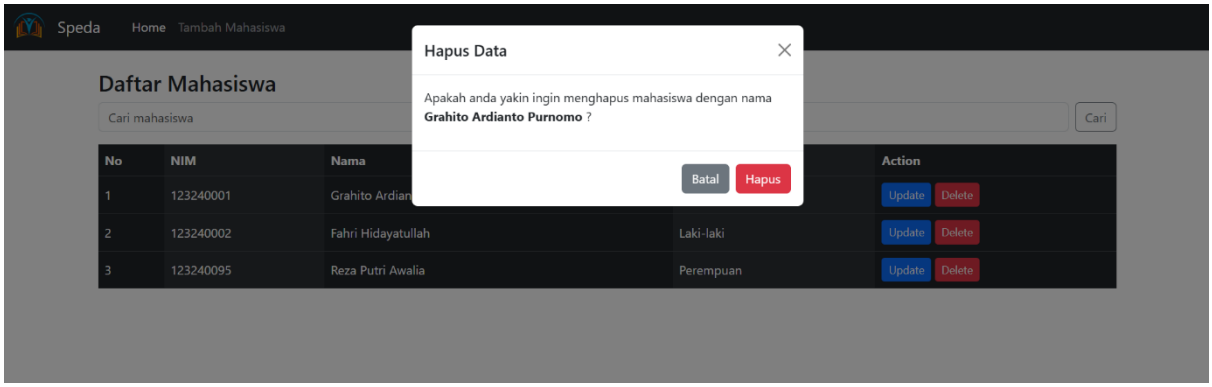

Main Dashboard page (if data is available)

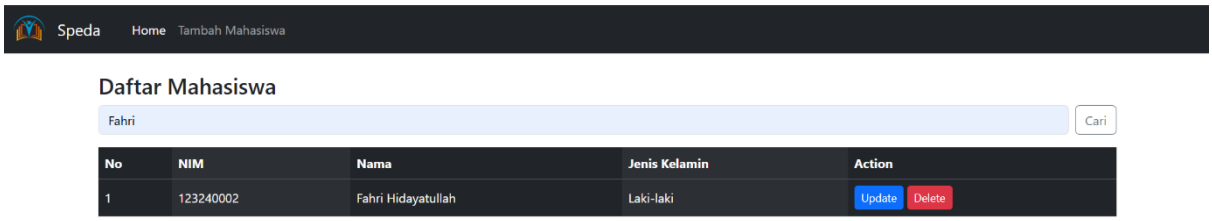

Add Data Page, where input is saved into the database.

Update Data Page retrieves the selected data and allows for modifications. The title and button have been changed to "Update," as shown in the image above.

When you choose to delete data, a pop-up appears, displaying the name of the item to be deleted.

Since there is a search bar in the interface, make sure it’s functional, just like in the image.

➢ Submission Instructions :

1) File names are flexible but must include the form page, the results page, and any supporting files, if necessary.
2) Compile all files into a .zip file using the naming convention NIM_ Assignment3.zip
